pCR primers AAV42367-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA alpha: virus structural protein expression cassettes - for producing

It was used with nested primer HDV17-68 (AAT30817) and reverse primer SHDV84R (AAT30818) to generate an HDV 11bozyme. This antigenomic ribozyme can be placed between the polyA tract at the 3' end of a Sindbis virus-based eukaryotic layered vector initiation system, ELVIS, and the transcription terminal signals to produce alphavirus expression vectors useful in methods of gene therapy and for vaccine produ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                     PCR primers AAV42167-420 and AAV42422-54 are used in the course of the invention. The specification describes a DNA alphavirus structural protein expression casecte which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter directs the expression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell, the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the expression cassette. The products may be used to inhibit pathogens and stimulate an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryotic layered vector initiation system; stimulate; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAV60153-55 are used to amplify Hepatitis delta virus ribozyme sequence. The product is used in the course of the invention.

The specifiaction describes an eukaryotic layered vector initiation system comprises a eukaryotic promoter 5' of viral cDNA which initiates, in a susceptible target cell, 5' to 3' synthesis of RNA from the viral cDNA. The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an antigen by introducing the vector into target cells, preferably by infection in vivo, especially where the immune response is a cell mediated, HLA class I-restricted or an HLA class II-restricted or an HLA class II-restricted immune response. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Eukaryotic layered vector initiation system - containing eukaryotic promoter and heterologous antigen coding sequence, useful for stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              layered vector initiation system; stimulate; immune response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PCR primers AAV60184-85 are used in the course of the invention. The specifiaction describes an eukaryotic layered vector initiation system, based on Sindbis. The eukaryotic layered vector initiation system comprises a eukaryotic promoter 5. of viral cDNA which initiates, in a susceptible target cell, 5' to 3' synthesis of RNA from the viral cDNA.
                                                                                                                                                                                                                                                                                                                                          Gape

The RNA comprises a vector construct which autonomously amplifies in the cell and expresses a heterologous nucleic acid sequence which encodes an antigen or modified form that stimulates an immune response within an animal. The system is useful for stimulating an immune response to an infection in vivo, especially where the immune response to an infection in vivo, especially where the immune response is a cell mediated, HIA class I restricted or an HIA class II-restricted immune response. (Updated on 25-MAR-2003 to correct PR field.)

```

PCR primers AAV70745-46 are used to amplify part of the hepatitis delta virus (HDV) genome. The amplified product is used in the production of the alphavirus vector constructs of the invention. These constructs comprise a promoter 5' of viral cDNA which initiates the synthesis of RNA from the viral cDNA by in vitro transcription, followed by a 5' sequence sequence encoding alphavirus nonstructural proteins, a viral junction region which has been inactivated such that viral transcription of a subgenomic fragment is prevented, an internal ribosome entry site or a sequence which promotes ribosome read through between adjacent reading frames, and an alphavirus RNA polymerase recognition sequence. The 20-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 54,

                                                                                                                                                                                                                ô
                          This is the nucleotide sequence of bimolecular ribozyme RzB fragment. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence S'-H'*GNNHNN-3'. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site is represented by *). At least one nucleotide is present 5' to the cleavage site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other therapeutic, biotechnological and diagnostic applications
                                                                                                                                                                                                                                                                                                                                                                     Trans-acting antigenomic delta ribozyme, deltaRzP1.1 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /bound_moiety= "SP1.1 substrate (AAZ57641) bases 5-11"

                                                                                                                                                                                                                           This is the nucleotide sequence of ribozyme deltaRzP1.1. This ribozyme cleaves substrate SP1.1 (see AAS7641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme has the sequence 5'-H'*GNNHNN-3'. The binding portion of the enzyme in the sequence 5'-H'*GNNHNN-3'. The binding portion of the substrate (cleavege site to 6 nucleotides 3' to the cleaved site of the substrate (cleavege site is represented by *). At least one nucleotide is present 5' to the cleavege site of the substrate sequence. The enzyme of the invention is used to cleave a substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave viral RNA or RNA causing for example an inherited disease. The enzymes also have other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Trans-acting antigenomic delta ribozyme, deltaRzP1.2 nucleotide sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ઠે
                                                                                       This is the nucleotide sequence of ribozyme deltaRzPl.2. This ribozyme cleaves substrate SP1.2 (see AAZ57644). The invention relates to a nucleic acid maryme (e.g. deltaRzPl.2) that is constructed to have a substrate binding portion with the following sequence 3'-UNNXNN-5'. The substrate of the enzyme (ribozyme) base pairs to 6 nucleotides 3' to the cleavage site of the substrate (cleavage site of the substrate nucleotide sequence at a specific cleavage site by mixing the substrate (continue) is used to cleave a substrate (continue) in the enzyme is used to cleave in a substrate in the reapeutic, biotechnological and disquesting also have other sequence is not shown in the specification, but has been derived from the deltaRzPl.1 sequence (AAZ57636) shown in figure 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               l. .6

This is the nucleotide sequence of a trans-acting antigenomic delta ribozyme of the invention. This ribozyme cleaves substrate SP1.1 (see AAZ57641). The invention relates to a nucleic acid enzyme (e.g. deltaRzP1.1) that is constructed to have a substrate binding portion with the following sequence 3 -UNNXNN-5. The substrate of the enzyme has the sequence 5 -H*GNNHNN-3. The binding portion of the enzyme (ribozyme) base pairs to 6 nucleotides 3 to the cleavage site of the substrate of cleavage site is represented by *). At least one nucleotide is present 5 to the cleavage site of the substrate encleotide sequence at a specific cleavage site by mixing the substrate nucleotide sequence at a specific cleavage site by mixing the substrate with the enzyme. The enzyme is used to cleave a substrate with the an inherited disease. The enzymes also have other therappeutic, biotechnological and disagnostic applications. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New CGX polypeptides and polynucleotides, useful in diagnosing, treating and/or preventing colon and gastric cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               colorectal cancer; colon cancer; gastric cancer; antisense therapy; gene silencing; drug screening; detection; diagnosis; predisposition; cytostatic; vaccine; CGX7; Nkd1; reverse transcription-PCR; RT-PCR;

The invention relates to human colon and gastric cancer-associated (CGX) proteins and their encoding nucleic acids which are differentially expreteins and their encoding nucleic acids which are differentially in capretelal or gastric cancer. 7 of the 8 CKG genes colon cancer-associated genes, 2 [Ly6E (CGX6) gastric cancer. 6 [Ly6E (CGX6) and Ncd1 (CGX7)) were known but had not previously been associated with colon cancer. and 5 were novel. The novel colon cancer-associated genes, 2 [Ly6E (CGX6) and Ncd1 (CGX7)] were known but had not previously been associated with colon cancer. and 5 were novel. The novel colon cancer-associated genes are given in ADL66355). The proteins encoded by these comprising a CGX1-5 nucleis of carcial acid, methods for the recombinant production of CGX1-5; antibodies specific for CGX1-5; antisense polymucleotides or comprising a CGX1-5 nucleic acid, methods for the recombinant production of CGX1-5; antibodies specific for CGX1-5; antisense polymucleotides or methods of treating or preventing colon or gastric cancer; methods of screening for compounds for treating or preventing colon or gastric cancer; methods of screening for compounds for treating or preventing colon or gastric cancer; method for more genes selected from CGX1-7 or CGX8 polymolations for the treatment or preventing colon or gastric cancer comprising a pharmaceutical amount of a CGX polypeptides or fragment thereof, an anticody an antisense polymucleotide, an altificed by screening. The polypeptides, colon and gastric cancer comprising to the treatment or prevention of colon or gastric cancer comprising a pharmaceutical amount of a CGX polypeptide, colon and sirNA, or a compound, identified by screening. The polypeptides, and some colon and gastric cancer or a predisposition are useful in diagnosing colon and gastric cancer or a predisposition or developing colon or gastric cancer and in treating or prevente transcription-PCC The present sequence represents a reverse transcription or colon and gastric cancer and in trea
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                AAQB1580-QB3630 are HIV-1 Rev protein RNA ligands, which were modified by the inclusion of a photoreactive group/s to demonstrate a new nucleic acid (NA) ligand selection method. Where the ligands with a high affinity for the target NA (after irradiation) photocrosslink, enabling them to be seperated from the ligands with low affinity for the target NA. (Updated on 25-MAR-2003 to correct PN field.)
              Selecting nucleic acid ligands for target molecules - by forming complexes then partitioning by photocrosslinking a selective soln. phase extension, useful e.g. in diagnosis or treatment of disease.

Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus Claim 1; Page 261; 387pp; English infection. invention 

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acid such as hammerhead ribozymes, DNAzymes, inczymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, compounds and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV C genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HCV infection or minus strand DNAzyme sequences disclosed in the present

```
The invention relates to an enzymatic nucleic acid molecule which specifically cleaves RNA derived from hepatitis C virus (HCV), in which the binding arms of the enzymatic nucleic acid molecule comprises sequences complementary to any of the defined substrate sequences given in the specification. The nucleic acid molecule may be administered for the treatment of HCV infections, especially in combination with type I interferons. The present sequence represents a HCV DNAzyme substrate

Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer. 

Example 1; Page 17; 72pp; Japanese.

peptide containing a CTL (cytocoxic T lymphocyte) epicope recognised by cytotoxic T cells and a protein containing the ATPade domain of a heat shock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (1) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a primer which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         peptide containing a CTL (cytocoxic Tymphocyte) epitope recognised by cytocoxic T cells and a protein containing the ATPase domain of a heat shock protein. Also described are: (1) a drug composition containing (1) as active ingredient; (2) a DNA encoding (1); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the proteozoacide activities, and can be used as cellular immunes response inducer. The protein is useful as an active ingredient for drug malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a primer which is used in an example from

                                                                                                                                                 The present invention describes a fused protein (I) prepared from a peptide containing a CTL (cytotoxic T lymphocyte) epitope recognised by cytotoxic T cells and a protein containing the Arpase domain of a heat shock protein. Also described are: (I) a drug composition containing (I) as active ingredient; (2) a DNA encoding (I); (3) an expression vector containing the DNA of (2); and (4) a transformant which can retain the expression vector of (3). (I) has cytostatic, immunostimulant and protozoacide activities, and can be used as a cellular immune response inducer. The protein is useful as an active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer e.g. to provide systemic immunity against leukaemia. The present sequence represents a primer which is used in an example from
Fused protein capable of inducing cellular immune response, useful as active ingredient for drug compositions in preventing and/or treating infectious diseases such as malaria or cancer.

The invention relates to an oligonucleotide array (I) comprising at least different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) suseful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an oligonucleotide array (I) comprising at least
             Array comprising adapter sequences useful for immobilizing or detecting target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Array comprising adapter sequences useful for immobilizing or del
target nucleic acid sequence, has different addresses comprising

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                           Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in AB000010-AB013409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (AB000010-AB013409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a method for treating type II diabetes mellitus, by administering a GLP-1 or a GLP in thein, particularly the mutein GLP-1-Gly8. The GLP-1 mutein is an insulinotropic peptide. The method is used to treat type II diabetes (non-insulin dependent diabetes mellitus) and obesity
                                                                                                                                                                                                                                                                                                                                 Glucagon-like peptide-1; GLP-1; mutein; type II diabetes mellitus; insulinotropic peptide; non-insulin dependent diabetes mellitus; obesity; therapy; PCR primer; ss.

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreais. Vector DNA was prepared from a derivative of pwD42 (gij473214 gbp hR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion within the locus defined by BAC clone

MTH12. Details on the protocols used for generation of the sequences are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the Context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI-Kat is part of the German Plant Genomics program at: http://www.mpiz-koeln.mgg.de/GABI-Kat/.

The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion.
Arabidopsis thaliana T-DNA flanking sequence GK-467C08-019014, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

L. Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer

Succhtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany

This sequence has been recovered from the left border of the T-DNA.

It indicates an insertion close to or within gene At2g21630.

Details on the protocols used for generation of the sequence are

described in References 1-3. The sequences are generated at the MPI

for Plant Breeding Research in the context of the GABI-Kat project

GABI-Kat is part of the German Plant Genomics program designated

Submitted (31-MAR.2004) Weisshaar B., Max-Planck-Institut fuer Zuechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone requence are described in References 1.3. The sequences are described in References 1.3. The sequences are described in References 1.3. The sequences the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated GABI. Information on line availability can be found at: http://www.mpiz.koeln.mpg.de/GABI-Kat/.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Weisshaar, J., J., Meisshaar, B., Meisshaar, Meisshaar, B., Meisshaar, B.
An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for flanking sequence tag-based reverse genetics
Plank Mol. Biol. 53 (1-2), 247-259 (2003)
                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Arabidopsis thaliana T-DNA flanking sequence GK-765D01-023592,

Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Submitted (31-MAR-2004) Weisshaar B., Max-Planck-Institut fuer Suechtungsforschung, Carl-von-Linne-Weg 10, Koeln, 50829, Germany This sequence has been recovered from the left border of the T-DNA. It indicates an insertion within the locus defined by BAC clone are described in References 1-3. The sequences are generated at the MPI for Plant Breeding Research in the context of the GABI-Kat project. GABI-Kat is part of the German Plant Genomics program designated 'GABI'. Information on line availability can be found at: http://www.mpiz-koeln.mpg.de/GABI-Kat/.
                                                                        Inotes PCR was performed on DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC16 I (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment(s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Weisshaar,B.
An Arabidopsis thaliana T-DNA mutagenized population (GABI-Kat) for
flanking sequence tag-based reverse genetics
Plant Mol. Biol. 53 (1-2), 247-259 (2003)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    BX292021 46 bp DNA linear GSS 02-APR-2004 Arabidopsis thaliana T-DNA flanking sequence GK-450B01-019252,

/note="PCR was performed on DNA from Arabidopsis thaliana plants (TI) which were transformed with the T-DNA from vector pAC161 (GenBank accession number: AJ537514). The lines contain one or more T-DNA insertions. The DNA fragment (s) resulting from the PCR were directly sequenced to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed.
                                                                                                                                                                                                                                                                                                                                                                        ö
